

ABSTRACT OF THE DISCLOSURE

A positioning device for a roofing washer dispenser includes a plurality of protrusions extending from an inner periphery of the hole defined through a plate connected to the dispenser. A feeding device has a pushing plate
5 which is movably engaged with the groove so as to feed a washer in the groove into the hole. The protrusions are located at an intermediate point of a width of the inner periphery of the hole so that the washer can be supported by the protrusions before it is penetrated by the nail.
